Lifespan of Lifejackets

The service life of inflatable lifejackets is limited to a maximum of 15 years (spinlock lifejackets a maximum of 10 years). This requires regular maintenance of the waistcoat by a service station authorised by the manufacturer. The following intervals are prescribed for maintenance:

Use in leisure shipping: **Biennial maintenance**

Use in commercial shipping or intensive leisure use: **Annual maintenance**

Annual maintenance is mandatory from the 10th year. A inflatable lifejackets must be replaced after a service life of 15 years. The service sticker attached to the lifejacket indicates the period of use until the next maintenance.

Our maintenance flat rate includes

- Checking the waistcoat body, seams, straps and fittings for damage
- At least 16 hours pressure and leak test of the inflated buoyancy chamber
- Check the automatic release unit and the inlet valve, replace the release unit
- Replacement of all seals
- Functional test of the mouth valve and, if present, the pressure relief valve
- Checking the CO2 cartridge for leaks, corrosion and weight
- Proper packing of the waistcoat, renewal of the service sticker, maintenance log

Extra Services (if necessary or by arrangement)

- Cost of the trigger unit (UML cartridge, HR capsule or MA1 trigger-unit)
- Cost of CO2 cartridge (only necessary in case of corrosion, leakage or triggered cartridge)
- Costs for replacement of emergency light, repair of cover, harness, valves, other spare parts etc.
- You have no risk - if disproportionately high repair costs are incurred, we will contact you before starting the work.

We only use original spare parts and tools. The maintenance regulations of the waistcoat manufacturers and our prices for maintenance and spare parts on our website apply.
